SUMMARY

MBA student in Data Analysis with hands-on experience in SQL, Python, Power BI, and Excel. Built 4 end-to-end projects on datasets of up to 100,000 rows, covering data cleaning, analysis, dashboards, and business recommendations. Looking for an entry-level Data Analyst role.

SKILLS

Querying and Programming: SQL (MySQL: CTEs, window functions, subqueries, views, joins), Python (Pandas, Matplotlib, Jupyter)
BI and Visualization: Power BI (multi-page dashboards, KPI cards, slicers), Excel (COUNTIFS, SUMPRODUCT, AVERAGEIF), Tableau
Analytical Methods: Data Cleaning and Validation, Exploratory Data Analysis, KPI Design, Hypothesis Testing, Business Recommendations

PROJECTS

Food Delivery Analytics | *Excel, Python, MySQL, Power BI* GitHub

- Analyzed 100,000 food delivery orders to find where profit is lost. Used Excel for data checks, Python for cleaning, MySQL for business questions, and Power BI for a 4-page dashboard.
- Found that small orders (up to Rs 200) made up about 76% of all loss-making orders, and that discounted orders earned about Rs 83 profit versus Rs 126 without a discount.
- Recommended a minimum order fee and a no-discount test group. Confirmed the KPIs matched across Python, SQL, and Power BI.

HR Analytics: Workforce and Attrition | *Excel, Python, MySQL, Power BI* GitHub

- Analyzed attrition across 50,000 employee records (33.26% attrition). Tested 30 factors with Mann-Whitney and chi-square tests (Bonferroni-corrected) and built two predictive models.
- Found no significant driver of attrition (0 of 30 tests significant, model AUC about 0.50) and reported it as it was instead of forcing a pattern.
- Flagged 6 data-quality issues, such as 3,373 invalid hire ages, instead of dropping rows. Built a 3-page Power BI dashboard.

Customer Shopping Behavior Analysis | *Python, MySQL, Power BI, Excel* GitHub

- Cleaned 3,900 retail transactions in Pandas: filled missing ratings with category medians and created age-group and purchase-frequency features.
- Answered 10 business questions in MySQL using CTEs, subqueries, and ROW_NUMBER window functions. Built a Power BI dashboard with KPI cards and slicers.
- Found that Clothing led revenue ($104K of $233K), only 27% of customers were subscribers, and 43% of purchases used a discount.

E-commerce Sales Analysis | *MySQL* GitHub

- Built a full SQL workflow on 500 orders: staging tables, missing-value and duplicate checks, cleaning, final tables, EDA, KPIs, and recommendations across 12 scripts.
- Found that Electronics sold the most but Clothing had the better margin, and Tamil Nadu was loss-making. Total sales were Rs 431,502 at a 5.55% profit margin.
- Joined monthly sales targets to actual sales and found Clothing missed its target by 78.71% in July 2018.
